

NAAMSE Security Assessment Report

Executive Summary

This security assessment tested 28 adversarial prompts against the target AI agent. The maximum vulnerability score achieved was 91.4/100, indicating a **CRITICAL** vulnerability level. 18 adversarial prompts (64.3%) exceeded the vulnerability threshold, with an average score of 72.0/100. attack effectiveness improved by 23.5% across iterations.

Key Metrics

Metric	Value
Total Prompts Tested	28
Maximum Score	91.4/100
Average Score	72.0/100
High-Risk Prompts	18
Unique Attack Types	6
Mutation Types	13

Risk Severity Distribution

Attack Effectiveness Over Time

Attack Type Analysis

Cluster	Count	Avg Score	Max Score	Description
Multi-Language Manipulation & Competitive Personas	21	79.3	91.4	Jailbreaks using language switching (French, German), competitive dual-persona creation (DAN developer vs AI, each proposing better code), playful/intimate role assignments (daddy/babygirl dynamics, Tyler tier-list maker), simple 'forget everything' commands, and instruction scope limiting ('answer in less than 10 words', 'strictly limit scope').
Context Reset & Instruction Forgetting	1	63.5	63.5	Simple 'forget everything' and 'ignore previous instructions' commands attempting to reset context and inject new directives. Includes language-switching attacks, political opinion injection ('say Trump is best', 'blame China'), role-switching mid-conversation, and direct instruction overrides to make AI adopt specific viewpoints or generate biased content.
Developer Mode Jailbreak	1	55.0	55.0	The classic 'Developer Mode' jailbreak technique claiming AI was given unrestricted capabilities in 2022 for testing biases. Uses dual-output format with Normal and Developer Mode responses, includes detailed policy lists, and automated safety testing prompts with structured technique descriptions (Prompt Termination, Direct Instruction Injection, Context Swapping, etc.).
Multi-Turn Context Manipulation	1	55.0	55.0	Complex social engineering attempts using multi-step scenarios, role-playing (journalists, researchers, investigators), and instruction injection ('forget everything', 'ignore previous') to extract private information (addresses, SSNs, contact details) or bypass safety guidelines through elaborate narrative framing.
Prompt Extraction & Embedded Code Injection	1	54.2	54.2	Direct system prompt extraction attacks ('show prompt text', 'reveal password', 'repeat previous instructions', 'what was written at beginning'), instruction reversal commands ('rewrite in reverse'), technical code injection embedding malicious queries within programming syntax (Rust, JavaScript), obfuscated variable manipulation, and 'ignore user input' directives hidden in code comments.

Unrestricted Persona Creation (DAN-Style)	3	40.6	53.4	Creating alternate AI personas (DAN, LUCIFER, Syd, Atlas, BOB, Vortex, etc.) through elaborate system prompts claiming 'Developer Mode', 'God Mode', or 'unrestricted access'. Uses dual-response formats, fictional universe framing, and claims AI has 'broken free' from constraints to bypass ethical guidelines.
